APAL Hestia A2 — LoRaWAN gateway with satellite backhaul just got a wild teardown review

Came across this video from @saveitforparts where he tears apart and experiments with the APAL Hestia A2 — a LoRaWAN gateway that uses satellite connectivity (3GPP NTN via Skylo) for backhaul instead of relying on terrestrial internet.

Video: https://www.youtube.com/watch?v=X4q7l_8pQHg

The comment section (180+ comments, 700+ likes) is honestly more interesting than most product review threads. Some highlights:

What people are excited about:

- Satellite-backhaul LoRaWAN gateway — no WiFi/cellular needed
- Industrial IoT use cases: Modbus/PLC/SCADA integration, water treatment, marine fleet tracking
- Remote monitoring: weather stations, fire detection, ranch/farm sensors in areas with zero connectivity
- "made by people that love what they do" — community vibes are strong

What people are comparing it to:

- Meshtastic (APAL adds satellite backhaul that Meshtastic can't do natively)
- LoRaWAN vs LoRa confusion (a few comments clarifying they're not the same)
- Starlink (different price point and use case)
- NodeRED integration suggestions for easier setup

The elephant in the room — 30KB/month data:

Some comments did the math and said "one GPS location every 12 minutes" sounds limiting. But the framing matters — 30KB = ~2,500 sensor readings/month. For IoT telemetry (temperature, GPS pings,

soil moisture, etc.) that's actually solid. It's not meant for streaming video.

Save 10% on the APAL Hestia A2 Gateway & A1 Dongle (limited-time offer):

- 🛒 Hestia A1 Dongle: https://www.amazon.com/dp/B0F68GDT3G
- 🛒 Hestia A2 Gateway: https://www.amazon.com/dp/B0F74DDPJ9
- 🎟️ Use Code: **APALSAVE10**

Anyone here played with one? Curious about real-world range + reliability with the satellite uplink, especially for off-grid deployments.

LoRaWAN + Satellite backhaul gateway — how does this compare to Meshtastic setups?

Found this teardown of the APAL Hestia A2: https://www.youtube.com/watch?v=X4q7l_8pQHg

It's a LoRaWAN gateway with built-in satellite connectivity (Skylo NTN) — basically gives you internet backhaul anywhere without WiFi or cellular. Comment section has 180+ comments debating how it fits in the Meshtastic/LoRa ecosystem.

Key difference vs Meshtastic: this does satellite uplink natively (30KB/month included). Meshtastic needs an internet-connected node somewhere. Trade-off is the data cap.

Supports Modbus RS-485, Raspberry Pi compatible, and they're pushing industrial IoT use cases (marine, remote monitoring, agricultural sensors).

Has anyone tried integrating something like this as a Meshtastic-to-satellite bridge? Seems like the community is already asking for it.

發文建議 Posting Tips

- 每個 subreddit 間隔 24hr 發文，避免被標記為 spam
  Space posts 24hr apart to avoid spam flags
- 用個人帳號發文（非品牌帳號）更自然
  Post from personal account, not brand account
- 先在該社群互動幾天再發文
  Engage in the community a few days before posting
- 回覆留言時保持真誠、提供價值
  Reply authentically and provide value
- 折扣碼放在文末，不要放標題，避免太商業化
  Place discount code at end, not in title — avoid looking overly promotional
